# 1. PROJECT OVERVIEW

The **MERN Stack To-Do App** is a **full-stack web application** designed to help users manage their daily tasks efficiently.

This project is built using the **MERN stack** (MongoDB, Express.js, React.js, and Node.js) and follows modern web development practices. The backend handles user authentication, task management, and API requests, while the frontend provides a seamless and interactive user experience. The app also supports CRUD operations, allowing users to create, view, update, and delete tasks effortlessly.

## ❖ KEY OBJECTIVES

- **User-Friendly Task Management:** Provide an intuitive UI where users can efficiently add, edit, and organize their tasks.
- **Categorization for Better Productivity:** Introduce 7 cognitive-based task categories to help users optimize their workflow.
- **Seamless Authentication:** Ensure secure user login and signup using JWT-based authentication.
- **Real-Time Interactivity:** Implement React.js features like state management (Redux), React Hooks, and API integration for a smooth user experience.
- **Scalable Backend:** Use Node.js & Express.js for a scalable REST API with MongoDB as the database for storing users and tasks.
- **Responsive Design:** Ensure accessibility across different devices with a mobile-friendly UI.
- **Deployment & Hosting:** Deploy the frontend on Vercel and backend on Render or Heroku for easy accessibility.

# 2. TECH STACK

- **Frontend:** React.js with React Router DOM for navigation and Redux for state management.
- **Backend:** Node.js with Express.js for API handling.
- **Database:** MongoDB using Mongoose as an Object Data Modeling (ODM) library.
- **HTTP Client:** Axios for making API requests.
- **Authentication:** User authentication via JSON Web Tokens (JWT).
- **Styling:** Basic CSS and React Toastify for notifications.
- **Deployment:** GitHub and Vercel for hosting the front-end and backend.

### 3. FEATURES & FUNCTIONALITIES

#### ❖ USER AUTHENTICATION

- Users can sign up and log in using a secure authentication system.
- Authentication is managed using JWT.

#### ❖ TO-DO LIST MANAGEMENT (CRUD OPERATIONS)

- Create a new to-do item.
- Read and display all tasks.
- Update an existing to-do item.
- Delete tasks when completed or unnecessary.

#### ❖ UNIQUE FEATURE: TASK CATEGORIZATION

- Unlike conventional to-do apps, this application introduces a **7-category task division system** inspired by the book *Mind Management, Not Time Management*.
- Tasks are categorized based on mental energy, focus, and strategic impact rather than urgency or deadlines.
- This approach helps users optimize their productivity by working on tasks that align with their mental state and priorities.
- The seven categories from the book are:
  1. Effort – Tasks requiring intense focus and energy.
  2. Creative – Tasks that need innovative thinking.
  3. Productive – Routine and systematic work.
  4. Administrative – Organizational and planning tasks.
  5. Supportive – Helping others or responding to queries.
  6. Learning – Acquiring new knowledge or skills.
  7. Restorative – Activities that recharge energy and creativity.

#### ❖ FRONTEND UI

- Built using **React.js**.
- Uses React Router DOM for navigation.
- Implements useState and useEffect hooks.
- User-friendly interface with Toast notifications

## ❖ BACKEND API

- Developed using **Node.js** and **Express.js**.
- API routes for user authentication and CRUD operations.
- Handles authentication and request validation.

## ❖ DATABASE (MONGODB) DESIGN

- Mongoose is used to define schemas and interact with the database.

### 1. USERS COLLECTION (USERS)

```
{
  "_id": "ObjectId",
  "name": "John Doe",
  "email": "johndoe@example.com",
  "password": "hashed_password",
  "createdAt": "timestamp",
  "updatedAt": "timestamp"
}
```

### 2. TASKS COLLECTION (TASKS)

```
{
  "_id": "ObjectId",
  "userId": "ObjectId",
  "title": "Complete project report",
  "description": "Write the final project report and review before submission",
  "category": "Productive",
  "status": "Pending",
  "priority": "High",
  "dueDate": "timestamp",
  "createdAt": "timestamp",
  "updatedAt": "timestamp"
}
```

### 3. SESSION TOKENS COLLECTION (SESSIONS)

```
{
  "_id": "ObjectId",
  "userId": "ObjectId",
  "token": "JWT_token_string",
  "expiresAt": "timestamp"
}
```

### 4. RELATIONSHIPS & INDEXING:

- One-to-Many Relationship (User -> Tasks).
- Indexed email field in users for fast lookup.
- Indexed userId field in tasks for efficient queries.
- Indexed category and status fields in tasks for filtering.

#### ❖ STATE MANAGEMENT (REDUX)

- Centralized state management using Redux.
- Ensures seamless data flow across the application.

#### ❖ CONNECTING FRONTEND & BACKEND

- CORS middleware is used to enable cross-origin requests.
- Axios is used to fetch data from the backend API.

#### ❖ DEPLOYMENT

- Hosted on GitHub and deployed via **Vercel**.
- Backend can be deployed on cloud services like **Render or Heroku**.

## 4. PROJECT STRUCTURE

### ❖ FRONTEND:

- React components for UI.
- Redux store for managing state.
- React Router DOM for navigation.

### ❖ BACKEND:

- Express.js for API routes.
- Mongoose models for database operations.
- JWT-based authentication.

### ❖ DATABASE:

- MongoDB collections for users and tasks.

## 5. CONCLUSION

The MERN To-Do App is a full-stack web application that demonstrates the implementation of user authentication, CRUD operations, and API integration. The project is structured to provide hands-on experience in modern web development and is designed to be scalable and maintainable. The unique 7-category task system differentiates this app by offering a new way to manage tasks based on mental workload and cognitive efficiency, making it more effective for productivity optimization.
